

Regionalization with Agent Assist

Regionalization with Agent Assist

Regionalization with Agent Assist

Regionalization with Agent Assist

- Agent Assist provides **data residency** to keep your data-at-rest physically within a specified geographical region or location.
- When you specify a region, your data-at-rest is not stored outside that region. Pricing is the same for all regions.

Regionalization with Agent Assist

- Regionalization is helpful in scenarios when:
 - Your system has regulatory or policy requirements that govern where your data must reside.
 - Your network latencies might be improved when the data is in the same region as your customers.

Regionalization with Agent Assist

- Note that Agent Assist regionalization and data residency does not apply to data-in-use or data-in-transit.

Regionalization with Agent Assist

- Note that Agent Assist regionalization and data residency does not apply to data-in-use or data-in-transit.

Regionalization limitations in Agent Assist

Model training does not support regionalization. Your data may get routed outside the region during this process.
